Feature extraction

Robert Haase

Lecture overview: Bio-image Analysis

- Image Data Analysis workflows
- Goal: **Quantify observations, substantiate conclusions with numbers**
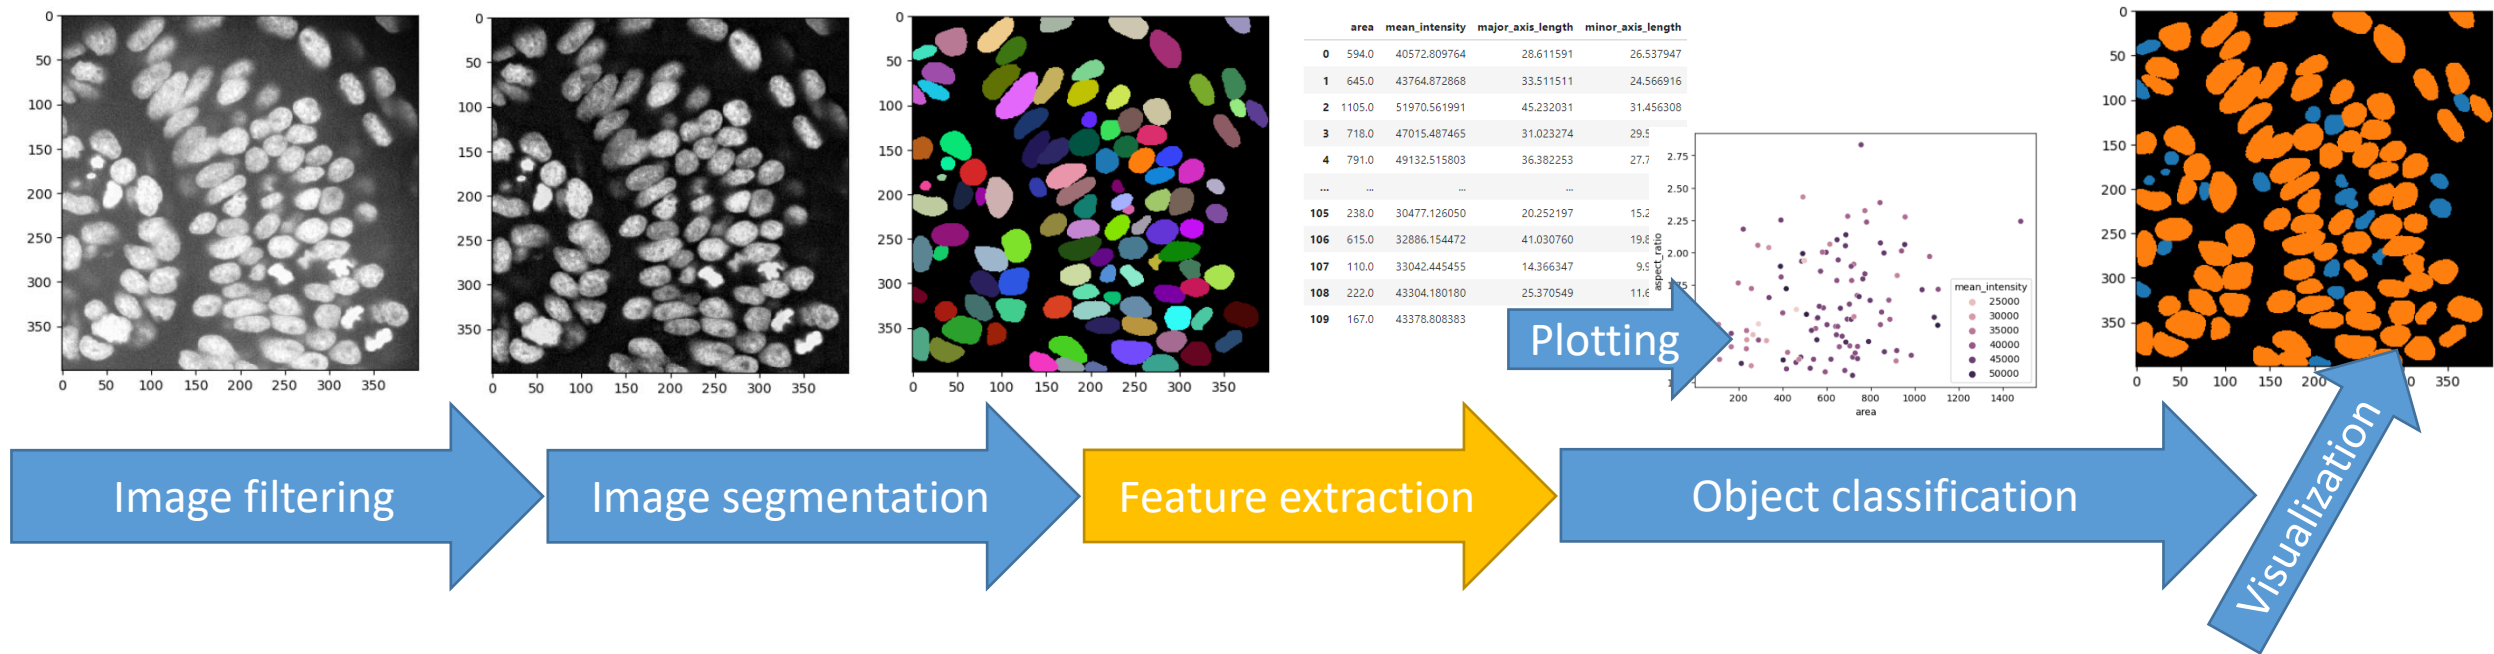

Feature extraction

- Feature extraction is a *late* processing step in image analysis.

- It can be used for images or

Feature Extraction

- or segmented/labelled images

Acquisition › Denoising › Background subtraction › Segmentation › Labeling › Feature Extraction

Robert Haase
@haesleinhuepf
BIDS Lecture 5/14
April 30th 2024

Image data source: Daniela Vorkel, Myers lab, MPI CBG

Feature extraction

- A *feature* is a countable or measurable property of an image or object.

- Goal of feature extraction is finding a minimal set of features to describe an object well enough to differentiate it from other objects.

- **Intensity based**
  - Mean intensity
  - Standard deviation
  - Total intensity
  - Textures

- **Mixed features**
  - Center of mass
  - Local minima / maxima
  - Distance to neighbors
  - Average intensity in neighborhood

- **Shape based /spatial**
  - Area / Volume
  - Roundness
  - Solidity
  - Circularity / Sphericity
  - Elongation
  - Centroid
  - Bounding box

- **Spatio-temporal**
  - Displacement,
  - Speed,
  - Acceleration

- **Topological**
  - Number of neighbors

- **Others**
  - Overlap
  - Colocalization

Robert Haase
@haesleinhuepf
BIDS Lecture 5/14
April 30th 2024
Intensity based features

- Min / max
- Median
- Mean
- Mode
- Variance
- Standard deviation

- Can be derived from pixel values
- Don't take spatial relationship of pixels into account

- See also:
  - descriptive statistics
  - histogram

Robert Haase
@haesleinhuepf
BIDS Lecture 5/14
April 30th 2024
Reminder: Measure on raw data

- In case thresholding algorithms outline the wrong structure, <u>blurring in advance</u> may help.

- However: **Do not** continue processing the blurred image, continue with the original!

Blurring + Thresholding ☺

Thresholding ☹

Contour on original image

Robert Haase
@haesleinhuepf
BIDS Lecture 5/14
April 30th 2024
Bounding rectangle / bounding box

- Position and size of the smallest rectangle containing all pixels of an object
  - x_b, y_b ... position of the bounding box
  - w_b ... width of the bounding box
  - h_b ... height of the bounding box

variable	value
x_b	0
y_b	2
w_b	3
h_b	2
Center of mass

- Relative position in an image weighted by pixel intensities

  - x, y … pixel coordinates
  - w … image width
  - h … image height
  - μ … mean intensity
  - $g_{x,y}$ … pixel grey value
  - x_m, y_m … center of mass coordinates

$$\mu = \frac{1}{wh} \sum_{y=0}^{h-1} \sum_{x=0}^{w-1} g_{x,y}$$

$$x_m = \frac{1}{wh\mu} \sum_{y=0}^{h-1} \sum_{x=0}^{w-1} x \, g_{x,y}$$

$$y_m = \frac{1}{wh\mu} \sum_{y=0}^{h-1} \sum_{x=0}^{w-1} y \, g_{x,y}$$

"sum intensity"
"total intensity"

x_m = 1/7 (1·0 + 1·1 + 2·2 + 2·1 + 1·2) = 1.3

y_m = 1/7 (1·2 + 1·2 + 2·3 + 2·2 + 1·3) = 2.4

Center of geometry / centroid

- Relative position in an image weighted by pixel intensities
- Special case of center of mass for binary images
  - x, y ... pixel coordinates
  - w ... image width
  - h ... image height
  - µ ... mean intensity
  - $g_{x,y}$ ... pixel grey value, integer in range [0;1]
  - x_m, y_m ... center of mass coordinates

$$\mu = \frac{1}{wh} \sum_{y=0}^{h-1} \sum_{x=0}^{w-1} g_{x,y}$$

$$x_m = \frac{1}{wh\mu} \sum_{y=0}^{h-1} \sum_{x=0}^{w-1} x \, g_{x,y}$$

$$y_m = \frac{1}{wh\mu} \sum_{y=0}^{h-1} \sum_{x=0}^{w-1} y \, g_{x,y}$$

Number of white pixels

x_m = 1/5 (1·0 + 1·1 + 1·2 + 1·1 + 1·2) = 1.2

y_m = 1/5 (1·2 + 1·2 + 1·3 + 1·2 + 1·3) = 2.4

@haesleinhuepf
BIDS Lecture 5/14
April 30th 2024

Perimeter

- Length of the outline around an object
- Depends on the actual implementation
Feret's diameter

- **Feret's diameter** describes the maximum distance between any two points of an outline.

- The minimum caliper ("Minimum Feret") describes the shortest distance, the object would fit through.

- Feret and Minimum Feret do not need to be perpendicular to each other!

Caliper
Feret's diameter

- Feret's diameter (L.R. Feret, 1931) is often cited, but impossible to read online …

- The term "Feret's Diameter" was established in the 1970s

LA GROSSEUR DES GRAINS DES MATIÈRES PULVÉRULENTES

SOMMAIRE

AUSZUG

DIE KORNGRÖSSE PULVERFÖRMIGER STOFFE

Zur Kennzeichnung der linearen Grösse von Körnern einer bestimmten Kornfraktion, unabhängig von der Grössenordnung und dem zur Abscheidung benutzten Verfahren, scheint am geeignetsten das Mittel aus einer genügenden Anzahl von Messungen des Abstandes je zweier an entgegengesetzten Seiten des Umrisses der Körner gelegter Tangenten, die parallel zu einer beliebigen, aber für alle Messungen gleichen Richtung verlaufen. Die Messung geschieht unbahängig von der Lage der Körner zu der gewählten Richtung der Tangenten.

Auf Grund des so erhaltenen Mittelwertes, der als *mittlere Kornbreite* bezeichnet wird, baut Verfasser mittelst geometrischer Progressionen, die auf der Normalreihe von *Renard* beruhen, eine Einteilung nach Kornbreiten für das ganze Gebiet der gekörnten und staubförmigen Materialien auf. Die verschiedenen Kornklassen sind gekennzeichnet durch die Grenzwerte der entsprechenden *mittleren Kornbreiten* und ausserdem durch Namen, die so ausgewählt wurden, dass sie leicht in alle Sprachen eingeführt werden können.

Diese Einteilung wird vervollständigt durch eine Definition der *Kornzusammensetzung* unter Hinweis auf die Bestimmung der letzteren, entweder, ob diese Bestimmung in strenger Uebereinstimmung mit der allgemeinen Einteilung oder auf einfachere Weise im Hinblick auf gewisse gebräuchliche Anwendungen geschieht.

Minor / major axis

- For every object, find the optimal ellipse simplifying the object.
- Major axis … long diameter
- Minor axis … short diameter

- Major and minor axis are perpendicular to each other

Fit ellipse
Aspect ratio

- The aspect ratio describes the elongation of an object.

$$AR = major / minor$$
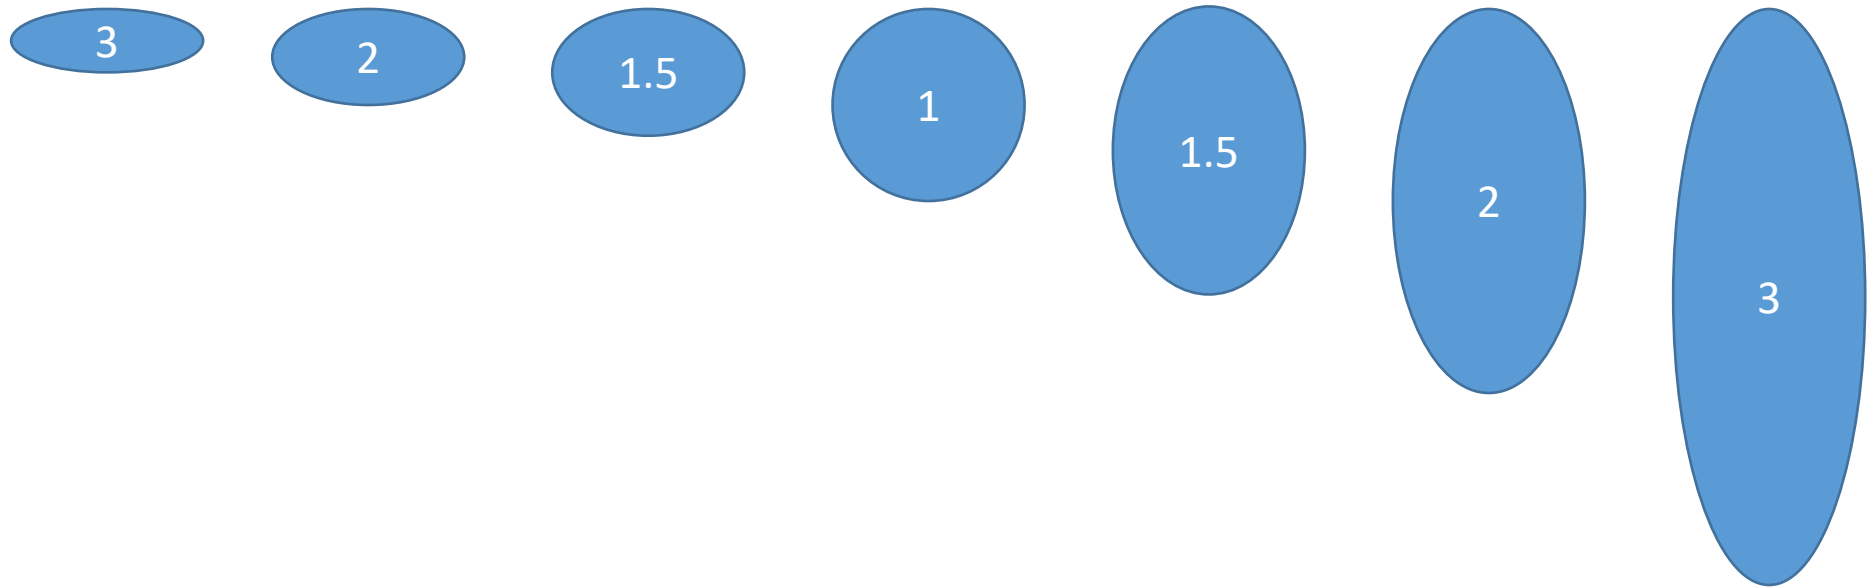

Convex hull

- By removing all concave corners of an object, we retrieve its convex hull.
Robert Haase
@haesleinhuepf
BIDS Lecture 5/14
April 30th 2024

Convex hull

- By removing all concave corners of an object, we retrieve its convex hull.

Convex hull

- By removing all concave corners of an object, we retrieve its convex hull.
Convex hull

- By removing all concave corners of an object, we retrieve its convex hull.
$$solidity = \frac{A}{A_{convexHull}}$$

Roundness and circularity

- The definition of a circle leads us to measurements of circularity and roundness.

- In case you use these measures, define them correctly. They are not standardized!
Diameter	d
Circumference	$C = \pi d$
Area	$A = \dfrac{\pi d^2}{4}$
$$roundness = \frac{4 * A}{\pi \, major^2}$$

$$circularity = \frac{4\pi * A}{perimeter^2}$$

Roundness = 1
Circularity = 1

Roundness ≈ 1
Circularity ≈ 1

Roundness < 1
Circularity < 1

Roundness versus circularity

- To decide which metric to use, consider drawing example object, which reflect the phenotype you are studying.

$$roundness = \frac{4 * A}{\pi \, major^2}$$

$$circularity = \frac{4\pi * A}{perimeter^2}$$
roundness: 1.00
circularity: 0.91
roundness: 0.86
circularity: 0.14
roundness: 0.64
circularity: 0.87

Feature extraction in Napari

- In Napari: Menu Tools > Measurements tables > Regionprops

Robert Haase

https://github.com/haesleinhuepf/napari-skimage-regionprops?tab=readme-ov-file#usage-measure-region-properties

Feature extraction in Python

- The transition from image data to tabular data / pandas DataFrames

```python
[4]: df = pd.DataFrame(regionprops_table(image , label_image,
                                         perimeter = True,
                                         shape = True,
                                         position=True,
                                         moments=True))
     df
```

Regionprops (scikit-image)

| image	nuclei (data)
labels layer	voronoi_otsu_labeling result
